1 Organizing Collaborative Research Teams

1.1 Communication (Gregor)

To organize a research team, it is of utmost importance to establish simple communication pathways. This includes ways to conduct text chat video conferencing, code sharing, editing, and task management.

In the following sections, we will list some useful tools that can be used by the research team while keeping the learning curve to a minimum. In general, it is good to ask the participants if they already use particular tools in a category and if all in the team use them to adopt them. However, this may limit the general availability in case the team grows into the open-source community. Hence, it is important to consider licensing issues and if possible adopt free tools for the research team.

1.1.1 Video Conferencing (Gregor)

Videoconferencing has undoubtedly become a major component of research teams. It allows face meetings without the need for traveling. Thus you can spend the time saved on travel. Also, it allows researchers to continue if unexpected events take place that does not allow in-person meetings such as the recent COVID epidemic.

There are many conferencing tools available that can be used. You may even use multiple dependent on the particular meeting or preferences by the subgroup. In order to keep things simple it is however recommended to just use one tool.

1.1.1.1 Google Meet (Shannon, Gregor) Google Meet is an online platform that allows groups of people to host video and audio conference calls. It has evolved from google hangout.

- What are good features? (Shannon)

Some good features of Google meet include that it has a button for closed captioning or subtitles in the case that you're having trouble hearing the speaker. It is also compatible across devices so it is very easy and accessible for all group members. The sound quality is very good.

- What are not so good features? (Gregor)

1. Google meet does not provide an easy way to have other take control of a remote desktop. However, it is possible to use Google Remote Desktop for it.
 - <https://remotedesktop.google.com/?pli=1>
2. Google meet does not have the ability to share each others desktops at the same time. This feature was available in hangout but is no longer available as far as we can tell.

- Why do we use google meet and not zoom? (Gregor)

Google offers many services that are useful for collaboration. This includes Google drive, docs, presentations, mail, calendar, and groups. features such as google drive. As they can be accessed through a single account, it is obvious that Google meet provides a valuable set of services to any research team.

1.1.1.2 Zoom (Fidel, Gregor) Zoom is a cloud-based communications platform that provides support for one-on-one, group meetings, and webinars and has recently become one of the most popular video-conferencing tools.

- What are good features? (Fidel, Gregor)

Some of Zoom's most popular features include live chat, screen sharing, a whiteboard, and virtual reactions for meeting participants. Additionally, the ability to record meetings to the cloud or personal devices, create breakout rooms and seamlessly move between them, remotely control a participant's screen and the functionality to share files in the meeting make Zoom into an attractive collaborative tool. Zoom allows users to join any session through an established meeting URL. Participants do not need to be signed in or even have a Zoom account. Additionally, people joining from places with limited Internet access can call into the meeting's audio channel using dedicated telephone numbers.

- What are not so good features? (Gregor, Fidel)

Free account holders can host unlimited one-on-one meetings (meeting durations up to 24 hrs). In contrast to Google meet, there is a duration limit of 40 mins for meetings with three or more participants, making it difficult even for small teams to take advantage of the platform's features. Additionally, we observed that video quality can be unstable, and the overall platform performance can quickly deteriorate over limited bandwidth connections. In such cases, we recommend switching the camera from the participant that has issues. Furthermore, if you do at the same time a lot of calculations on your machine it may affect the quality of the call. This applied to older machines and should allow you to give a beautiful argument to get a new computer. In some cases, you may have a second computer

and can use one for sharing your session, while the other one is used for sound, or you use a cell phone for the later

- How can someone take control of a remote desktop? (Fidel)

To take control of a remote desktop, the remote user must activate screen sharing. Once the screen sharing is activated, we need to click the **View Options** dropdown menu (usually at the top of the screen) and click on **Request remote control**. The remote user will then get a prompt to approve the remote control request.

Institutional accounts may have the remote control functionality disabled by their account administrator. For further details, refer to the Zoom support pages.

1.1.2 Realtime nad Offline Text Messaging (Gregor)

In many research projects participants may be in different timezones or have schedules that do not provide overlapping times for video-conferencing. For this reason it is important to support a chat like feature, that allows the researchers to catch up with activities that took place they were not avaiable for. Tools such as e-mail have filled this demand for quite some time. Recently addional tools such as Slack have appearde that enhance the e-mail activity while also allwing real time text messaging,

1.1.2.1 Slack (Gregor, Cooper) Slack is a communication software that is used for groups to send and receive text messages and access services that can be added to slack.

- What are good features? (Gregor)

Slack offers a GUI that is liked by many while focussing on a stream of messages. It can be used on any device. It is easy to send photos, which may be useful in case the device you need to discuss is not on the internet but you need to share the content for example of its screen.

- What are not so good features? (Gregor)

Slack is stream-based and does not provide a good mechanism for organizing messages. The thread feature is far inferior to that of even a simple e-mail client. If one is involved in many slack workspaces, it becomes difficult to manage them. Most importantly Slack comes in its free version with only a limited number of free messages. This means you will have to pay once you exceed the limit. Thus even the integration of useful services such as GitHub notifications is not recommended as you will too quickly exceed the limits. A posting policy needs to be established. Those that are not using slack frequently may be out of touch quickly. Although there is an unread threads feature, it may be filled with messages if you do not use slack daily just to keep up.

To support separation of topics it is advisable to create a number of channels such as “general” or a chanel for a particular topic. However it is also important to limit the number of channels so it does not become too confusing

- TODO: can slack configured to send e-mail?

1.2 Creating Text (Gregor)

TODO Introduction

1.2.1 Dictation (Windows 10 try out, Agness)

Sometimes it is conveneinet to directly dictate the text for a manual or tutorial into an editor. On MacOS and Windows you will find useful tools for this. A Voice to text recorder may also help you in case you have a recoded video of yourself to generate transcripts. Disadvantag for a lot of non Native english speakers is that the accuraccy may be limited and that not using them leads to unacceptable results. Some of them can be trained. Try it out and let us know if they work for you and if you are satisfied with their accuracy. Examples include:

- Apple Dictation (free for Apple devices) You can directly dictate into various applications that help you improving your text such as Grammarly and MS Word if you have installed them

cWindows 10 Voice Recognition (free for Windows users). You can directly record into MS Word so you get a free grammar checker > Agnes: I tried windows voice recognition and it did not work on my computer Google Docs offers built in voice typing for dictating Google voice has a very good recognition success rate it is fast but has at times difficulties recognizing names. In case it makes mistakes, you will have to clean it up after dictation.

- TODO: can we dictate into MS word?

1.2.2 Grammar Checkers (Gregor, review Erin)

When developing content for tutorials and documentation it is important to check their correctness with a grammar checker. We have made the best experience with Grammarly followed by MS word. The best way to use them is to copy and paste small sections into them from your document and then check them. After you are satisfied copy the contents back to the original one, while overwriting the old text.

- Grammarly
 - Pro: works well, is available for free, the free version is good enough
 - Cons: not everything is done correct. In some text it shows false errors, but it's still very good
- Word
 - Pros: those familiar with word will know it
 - Cons: sometimes Grammarly performs better, Copying text back and forth can introduce errors when it comes to using quotes and other symbols. Thus you must check all symbols after you copy it into a markdown document.

Recommendation: use Grammarly

1.2.3 Editors

You will need likely multiple two editors as part of your research activities. This is motivated by the fact that we do lots of development on your local machine, but also do remote development via terminal access to a remote computer that does not have a GUI. In case you only want to learn one editor to do all of this, just use emacs. We have listed below some editors and you may want to choose

- emacs vs vi/vim for terminal editing
- pycharm vs MS code for fancyful python code development

There is a third option that we will use and that is jupyter which allows us to interactively develop python code. Jupyter is important as it is used by many data scientist due to its ad hoc interactive mode while programming. However, also pycharm and vscode provide options to view and run jupyter notebooks. However, not everything that works in jupyter is working on these platforms.

Recommendation: Use emacs and pyCharm

Terminal Editors

- emacs
 - Pro: terminal, established, very good markdown support, block format with ESC-q, keyboard shortcuts also used in bash and other shells, has a python and markdown mode
 - Cons: some users have a hard time remembering keyboard shortcuts, the editor may get stuck in some unknown mode that you activated by accident. ALL this is easy to fix by remembering CTRL-X-s (save) and CTRL-G (get out of a strange mode)
- vi
 - use vim instead, vi is available on all Linux machines, but has rather archaic editing controls.
- vim
 - Pros: like vi, but with cursor control
 - Cons: often awkward to use

IDEs: * Pycharm * Pro: best Python editor * Cons: needs lots of resources, steep learning curve * Code (MS) * Pro: often used on Raspberry * Cons: Pycharm seems to have more features from the start

1.3 Documentation Development with Markdown ()

1.3.1 Markdown ()

TODO

- What is markdown?
- Why do we use it?
- What are good editors for markdown?
- Pointer to Gregor book
- Collaborative editing with HackMD.io

1.4 ToDo Lists

It is important to communicate quickly some tasks in the document that we write as a team. In order to do this we use the keyword TODO, followed usually by an explanation if needed. As a TODO can be hopefully resolved quickly it should be able to be completed in 1-2 hours. Any TODO that may take longer we also add to our GitHub project in order for it to be recorded and if we identify or delays in its execution we can assign additional team members to help on this tasks.

Once a team member has identified a TODO item, the team member can simply put his name behind it, as well as the date and time so others know you work on it. You can also communicate on slack about the task you do if you run into issues or have questions.

1.5 Git and GitHub

Git is a distributed version control system to support working on project in teams while allowing different team members to contribute and to curate the contribution through reviews.

GitHub is a service offered for free with the limitation that the repositories should not be larger than 1GB and the individual files must be smaller than 200MB. Github is very popular for OpenSource projects and through its free offering allows community building around OpenSource Projects.

1.5.1 Git from the commandline

Git can easily be installed on all platforms including

- macOS: You will need to install Xcode which includes not only git but user Linux programs such as Makefile
- Ubuntu: You can install it via `apt install git`
- Windows: You can install it via *Git Bash* which is distributed from <https://git-scm.com/downloads>. When installing read carefully the available options. We recommend you install a desktop shortcut.

1.6 Git from IDEs

Pycharm is one of the best editors for Python. It does provide built in support to interact with GitHub. This document here and I already went to some of your contributions and made improvements or two then OK

1.7 GitHub from a GUI

Some may fancy using a Graphical user interface to interact with GitHub. However, in many cases, the terminal access is simpler. However, if you like to browse the repositories and see the commit tree, these GUI interfaces are useful. Several such interfaces are available at:

- <https://git-scm.com/downloads/guis>

1.7.1 GitHub Commands

- What are the most important commands?
 - pull TODO
 - git add FILENAME TODO
 - commit -a TODO
 - push TODO
 - checkout branchname TODO

- What is a branch and how do we use it from the commandline?

TODO

- What if you committed something you did not want to and pushed it?

That is really bad and you need to contact Gregor. This will take hours to fix, so be careful. So make sure your code does not contain passwords in plaintext.

Also do never ever use the git command `git add .` as that adds all files and you could have files that you do not want to commit. instead **always** use `git add FILENAME`, where FILENAME is the file you like to add

1.7.2 Task Management

- Our tasks in Github TODO
- Our issues in GitHub TODO

1.7.3 Code Management

Our code is managed as open source code in github.

- Our code in GitHub

To check out use

```
git clone git@github.com:cloudmesh/cloudmesh-mpi.git
```

or

```
git clone https://github.com/cloudmesh/cloudmesh-mpi.git
```

1.7.4 Github Actions

We have not yet used them

TODO: provide description what they are

All: if you see a TODO, and want to do it (e.g. have 1-2 hours time, put your name to it so others know you will work on it. Do not assign a TODO to you if you do not have time and will do it in a month from now, Research tasks need to be done immediately. However we will also assign some longer term tasks to you so you can work ahead and in parallel, if your task is not done it will be assigned to some one else to mitigate that the time delay does not block the project.)

All: add tasks in github so we can assign todos and monitor progress

Gregor: Describe in detail how this is done

2 Appendix

2.1 Hardware of current students

- Fidel Leal,
 - Equipment
 - * MacBook Pro 2015, 16GB RAM i7, SSD 512GB
 - * PC, 64-bit, 8GB RAM, i5, SSD <240GB, speed>
 - Windows 10 Education
 - * Editor: Pycharm, vim
- Shannon Kerr,
 - Equipment
 - * Dell Inspiron, i5, 8GB, 1.6GHz 5482,
 - * HDD 1TB 5.4K 6GB/s
 - * Windows 64bit Home
 - * Editor: Vim
- Erin Seliger
 - Equipment
 - * Windows hp 2020, 16GB RAM, i7, 64-bit operating system
 - * Windows Pro 64bit
 - * Editor: Vim
- Cooper Young
 - Equipment
 - * Dell Inspiron 7000, i7 2 Ghz, 16GB RAM, Intel Optane 512GB SSD
 - * Windows 10 Education 64bit
 - * Vim, Pycharm, Pico
- Agness Lungu
 - Equipment
 - * Lenovo V570, 16GB RAM, intel(R) core(TM) i5-2430M, 64-bit operating system,
 - * Windows 10 Education
 - * editor: Vim, Pycharm
